**Amendments to the Claims:**

This listing of the claims will replace all prior versions and listings of the claims in this application.

**Listing of Claims:**

1. (currently amended)      [[An]]In a vehicle having a frame and a bumper, the improvement of an energy absorption impact system for vehicle bumpers and the like, comprising:

a mounting plate operably adapted to be connected with saida vehicle frame, and including a central opening extending therethrough; and

a generally box-shaped, sheet metal energy absorbing crush member having a top wall, a bottom wall and opposite sidewalls arranged in a generally frustro-pyramidal shape, defining a larger end thereof operably connected adapted for connection with saida vehicle bumper, and a smaller end thereof operably connected with said mounting plate about said central opening therein, whereby impact on said the vehicle bumper inelastically deforms said top wall, said bottom wall and said opposite sidewalls of said crush member toward said central opening in said mounting plate to absorb energy associated with the impact.

2. (previously presented)      An energy absorption impact system as set forth in claim 1, wherein:

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 5

said mounting plate includes at least one tab extending forwardly from said central opening and being rigidly connected with an adjacent one of said top wall, said bottom wall and said opposite sidewalls of said crush member.

3. (previously presented) An energy absorption impact system as set forth in claim 2, wherein:

said tab is connected with an interior surface of said one wall of said crush member, and folds inwardly with said one wall toward said central opening of said mounting plate upon impact to control energy absorption.

4. (currently amended) An energy absorption impact system as set forth in claim 4, wherein:

said sidewalls include an innermost sidewall facing a central portion of ~~said the vehicle~~ bumper, and an outermost sidewall facing an end portion of ~~said the vehicle~~ bumper; and

said tab is rigidly connected with the interior surface of said outermost sidewall to absorb energy from an impact having a significant side component.

5. (previously presented) An energy absorption impact system as set forth in claim 4, wherein:

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 6

said tab is integral with said mounting plate to define a one-piece structure.

6. (previously presented) An energy absorption impact system as set forth in claim 5,  
wherein:

said tab is stamped from material disposed within said central opening and bent  
forwardly along a fold edge.

7. (previously presented) An energy absorption impact system as set forth in claim 6,  
wherein:

said mounting plate includes a stiffening bead extending about the periphery of said  
central opening.

8. (previously presented) An energy absorption impact system as set forth in claim 7,  
wherein:

said central opening is defined by a top edge, a bottom edge and opposite side edges;  
and

each of said edges of said central opening includes one of said tabs extending forwardly  
therefrom.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 7

9. (previously presented) An energy absorption impact system as set forth in claim 8,  
wherein:

at least one of said sidewalls is disposed at a predetermined acute angle relative to an adjacent outer portion of said mounting plate to define at least a portion of said generally frustro-pyramidal shape.

10. (previously presented) An energy absorption impact system as set forth in claim 8,  
wherein:

each of said sidewalls is disposed at a predetermined acute angle relative to an adjacent outer portion of said mounting plate to define at least a portion of said generally frustro-pyramidal shape.

11. (previously presented) An energy absorption impact system as set forth in claim 10,  
wherein:

said top wall is disposed at a predetermined acute angle relative to an adjacent outer portion of said mounting plate to define at least a portion of said generally frustro-pyramidal shape.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 8

12. (previously presented) An energy absorption impact system as set forth in claim 11,  
wherein:

said bottom wall is disposed at a predetermined acute angle relative to an adjacent outer  
portion of said mounting plate to define at least a portion of said generally frustro-pyramidal  
shape.

13. (previously presented) An energy absorption impact system as set forth in claim 12,  
wherein:

said predetermined acute angle of each of said sidewalls of said crush member is  
substantially identical.

14. (previously presented) An energy absorption impact system as set forth in claim 13,  
wherein:

said predetermined acute angle of said top wall and said bottom wall of said crush  
member is substantially identical.

15. (previously presented) An energy absorption impact system as set forth in claim 14,  
wherein:

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 9

said predetermined acute angle of said top wall, said bottom wall and said opposite sidewalls is adjusted to vary the energy absorption for a specified impact system.

16. (previously presented) An energy absorption impact system as set forth in claim 15, wherein:

said top wall, said bottom wall and said sidewalls each have a predetermined thickness which is adjusted to vary the energy absorption for a specified impact system.

17. (previously presented) An energy absorption impact system as set forth in claim 16, wherein:

said crush member comprises first and second channel members, each having a substantially identical C-shaped lateral cross-sectional configuration with opposed side edges thereof rigidly interconnected along opposite seams to define said generally frustro-pyramidal shape.

18. (previously presented) An energy absorption impact system as set forth in claim 17, wherein:

said opposed seams are disposed in said top wall and said bottom wall.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 10

19. (previously presented) An energy absorption impact system as set forth in claim 17,

wherein:

said opposed seams are disposed in said sidewalls.

20. (currently amended) An energy absorption impact system as set forth in claim 19,

wherein:

said mounting plate has a generally flat outer portion, with a marginal edge having a stiffening bead extending along at least a portion thereof; and

said outer portion of said mounting plate is spot welded to an open forward end of said~~the~~ vehicle frame.

21. (previously presented) An energy absorption impact system as set forth in claim 20,

including:

fasteners detachably connecting said top wall, said bottom wall and said opposite sidewalls with said tabs to facilitate replacement of said crush member.

22. (currently amended) An energy absorption impact system as set forth in claim 21,

wherein:

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 11

said tabs are disposed at an angle relative to the outer portion of said mounting plate which is greater than the predetermined acute angle of said top wall, and said opposite ~~sidewall~~side walls, such that said fasteners resiliently bias said tabs abuttingly against said walls to preload said fasteners and securely retain the same in place.

23. (previously presented) An energy absorption impact system as set forth in claim 22, including:

weld nuts attached to said tabs and receiving said fasteners therein.

24. (previously presented) An energy absorption impact system as set forth in claim 23, wherein:

said mounting plate and said crush member are constructed from high strength steel.

25. (currently amended) An energy absorption impact system as set forth in claim 2, wherein:

said sidewalls include an innermost sidewall facing a central portion of ~~said the vehicle~~said bumper, and an outermost sidewall facing an end portion of ~~said the vehicle~~said bumper; and

said tab is rigidly connected with the interior surface of said outermost sidewall to absorb energy from an impact having a significant side component.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 12

26. (previously presented) An energy absorption impact system as set forth in claim 2,  
wherein:

said tab is integral with said mounting plate to define a one-piece structure.

27. (previously presented) An energy absorption impact system as set forth in claim 2,  
wherein:

said tab is stamped from material disposed within said central opening and bent  
forwardly along a fold edge.

28. (previously presented) An energy absorption impact system as set forth in claim 1,  
wherein:

said mounting plate includes a stiffening bead extending about the periphery of said  
central opening.

29. (previously presented) An energy absorption impact system as set forth in claim 1,  
wherein:

said central opening is defined by a top edge, a bottom edge and opposite side edges;  
and

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 13

each of said edges of said central opening includes a tab extending forwardly therefrom.

30. (previously presented) An energy absorption impact system as set forth in claim 1,  
wherein:

at least one of said sidewalls is disposed at a predetermined acute angle relative to an adjacent outer portion of said mounting plate to define at least a portion of said generally frustro-pyramidal shape.

31. (previously presented) An energy absorption impact system as set forth in claim 1,  
wherein:

each of said sidewalls is disposed at a predetermined acute angle relative to an adjacent outer portion of said mounting plate to define at least a portion of said generally frustro-pyramidal shape.

32. (previously presented) An energy absorption impact system as set forth in claim 31,  
wherein:

said predetermined acute angle of each of said sidewalls of said crush member is substantially identical.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 14

33. (previously presented) An energy absorption impact system as set forth in claim 1,  
wherein:

said top wall is disposed at a predetermined acute angle relative to an adjacent outer  
portion of said mounting plate to define at least a portion of said generally frustro-pyramidal  
shape.

34. (previously presented) An energy absorption impact system as set forth in claim 33,  
wherein:

said bottom wall is disposed at a predetermined acute angle relative to an adjacent outer  
portion of said mounting plate to define at least a portion of said generally frustro-pyramidal  
shape.

35. (previously presented) An energy absorption impact system as set forth in claim 34,  
wherein:

said predetermined acute angle of said top wall and said bottom wall of said crush  
member is substantially identical.

36. (previously presented) An energy absorption impact system as set forth in claim 31,  
wherein:

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 15

said predetermined acute angle of said opposite sidewalls is adjusted to vary the energy absorption for a specified impact system.

37. (previously presented) An energy absorption impact system as set forth in claim 1, wherein:

said top wall, said bottom wall and said sidewalls each have a predetermined thickness which is adjusted to vary the energy absorption for a specified impact system.

38. (previously presented) An energy absorption impact system as set forth in claim 1, wherein:

said crush member comprises first and second channel members, each having a substantially identical C-shaped lateral cross-sectional configuration with opposed side edges thereof rigidly interconnected along opposite seams to define said generally frustro-pyramidal shape.

39. (previously presented) An energy absorption impact system as set forth in claim 38, wherein:

said opposed seams are disposed in said top wall and said bottom wall.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 16

40. (previously presented) An energy absorption impact system as set forth in claim 1,  
wherein:

said mounting plate has a generally flat outer portion, with a marginal edge having a  
stiffening bead extending along at least a portion thereof; and

said outer portion of said mounting plate is spot welded to an open forward end of the  
vehicle frame.

41. (previously presented) An energy absorption impact system as set forth in claim 2,  
including:

a fastener detachably connecting said one wall of said crush member with said tab to  
facilitate replacement of said crush member.

42. (previously presented) An energy absorption impact system as set forth in claim 41,  
wherein:

said tab is disposed at an angle relative to the outer portion of said mounting plate  
which is greater than the predetermined acute angle of said one wall, such that said fastener  
resiliently biases said tab abuttingly against said one wall to preload said fastener and securely  
retain the same in place.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 17

43. (previously presented) An energy absorption impact system as set forth in claim 41,  
including:

a weld nut attached to said tab and receiving said fastener therein.

44. (previously presented) An energy absorption impact system as set forth in claim 1,  
wherein:

said mounting plate and said crush member are constructed from high strength steel.

45. (currently amended) A method for making an energy absorption impact system for  
vehicle bumpers ~~and the like~~, comprising:

forming a mounting plate with a central opening therethrough;

forming a generally box-shaped, sheet metal energy absorbing crush member having a  
top wall, a bottom wall and oppositely inclined ~~opposite~~ sidewalls arranged in a generally  
frustro-pyramidal shape, defining a larger ~~larger~~ end thereof adapted for connection with a  
vehicle bumper, and a smaller end thereof adapted for connection with said mounting plate;

positioning the smaller end of the crush member on the mounting plate about the central  
opening;

rigidly fastening the smaller end of the crush member to the mounting plate;

rigidly fastening the mounting plate to an end of a vehicle frame; and

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 18

connecting a vehicle bumper to the larger end of the crush member, whereby impact on the vehicle bumper inelastically deforms the top wall, the bottom wall and the opposite sidewalls of the crush member toward the central opening in the mounting plate to absorb energy associated with the impact.

46. (previously presented) A method as set forth in claim 45, wherein:

said mounting plate forming step includes forming at least one tab extending forwardly from the central opening, and rigidly connecting the tab with an adjacent one of the top wall, the bottom wall and the opposite sidewalls of said crush member.

47. (previously presented) A method as set forth in claim 46, wherein:

said tab connecting step includes connecting the tab with an interior surface of the one wall of the crush member, such that the tab folds inwardly with the one wall toward the central opening of the mounting plate upon impact to control energy absorption.

48. (previously presented) A method as set forth in claim 47, wherein:

said tab connecting step includes rigidly connecting the tab to the interior surface of the outermost one of the opposite sidewalls to absorb energy from an impact having a significant side component.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 19

49. (previously presented) A method as set forth in claim 48, wherein:

said tab forming step includes forming the tab integral with the mounting plate to define a one-piece structure.

50. (previously presented) A method as set forth in claim 49, wherein:

said tab forming step includes stamping the tab from material disposed within the central opening and bending the tab forwardly along a fold edge.

51. (previously presented) A method as set forth in claim 50, wherein:

said mounting plate forming step includes forming a stiffening bead about the periphery of the central opening.

52. (previously presented) A method as set forth in claim 51, wherein:

the central opening is defined by a top edge, a bottom edge and opposite side edges;  
and

said tab forming step includes forming one of the tabs at each of the edges of the central opening and bending the tabs forwardly therefrom.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 20

53. (previously presented) A method as set forth in claim 52, wherein:

said crush member forming step includes positioning at least one of the sidewalls at a predetermined acute angle relative to the adjacent outer portion of the mounting plate to define at least a portion of the generally frustro-pyramidal shape.

54. (previously presented) A method as set forth in claim 53, wherein:

said crush member forming step includes positioning each of the sidewalls at a predetermined acute angle relative to the adjacent outer portion of the mounting plate to define at least a portion of the generally frustro-pyramidal shape.

55. (previously presented) A method as set forth in claim 54, wherein:

said crush member forming step includes positioning the top wall at a predetermined acute angle relative to the adjacent outer portion of the mounting plate to define at least a portion of the generally frustro-pyramidal shape.

56. (previously presented) A method as set forth in claim 55, wherein:

said crush box forming step includes positioning the bottom wall at a predetermined acute angle relative to the adjacent outer portion of the mounting plate to define at least a portion of the generally frustro-pyramidal shape.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 21

57. (previously presented) A method as set forth in claim 56, wherein:

said sidewall positioning step includes positioning each of the sidewalls of the crush member at a substantially identical, predetermined acute angle.

58. (previously presented) A method as set forth in claim 57, wherein:

said top and bottom wall positioning step includes positioning the top wall and the bottom wall of the crush member at a substantially identical, predetermined acute angle.

59. (previously presented) A method as set forth in claim 58, wherein:

said crush member wall positioning step includes adjusting the predetermined acute angle of the top wall, the bottom wall and the opposite sidewalls to achieve the desired energy absorption for a specified impact system.

60. (previously presented) A method as set forth in claim 59, wherein:

said crush member forming step comprises selecting a predetermined wall thickness for the top wall, the bottom wall and the sidewalls to achieve the desired energy absorption for a specified impact system.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 22

61. (previously presented) A method as set forth in claim 60, wherein:

said crush member forming step comprises forming first and second channel members, each having a substantially identical C-shaped lateral cross-sectional configuration, positioning opposed side edges of the channel members together, and rigidly interconnecting the opposed side edges along opposite seams to define the generally frustro-pyramidal shape.

62. (previously presented) A method as set forth in claim 61, wherein:

said channel member connecting step includes forming the opposed seams in the top wall and the bottom wall.

63. (previously presented) A method as set forth in claim 61, wherein:

said channel member connecting step includes forming the opposed seams in the opposite sidewalls.

64. (previously presented) A method as set forth in claim 62, wherein:

said mounting plate forming step includes forming the mounting plate with a generally flat outer portion, and with a marginal edge having a stiffening bead extending along at least a portion thereof.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 23

65. (previously presented) A method as set forth in claim 64, wherein:

said mounting plate fastening step includes spot welding the outer portion of the mounting plate to an open forward end of the vehicle frame.

66. (currently amended) A method as set forth in claim 65, wherein:

said tab connecting step includes inserting threaded fasteners between the top wall, the bottom, the opposite sidewall~~side walls~~ and the tabs to facilitate replacement of said crush member.

67. (previously presented) A method as set forth in claim 66, wherein:

said tab forming step includes forming the tabs at an angle relative to the outer portion of the mounting plate which is greater than the predetermined acute angle of the top wall, the bottom wall and the opposite sidewalls, such that the fasteners resiliently bias said tabs abuttingly against the walls to preload the fasteners and securely retain the same in place.

68. (previously presented) A method as set forth in claim 67, including:

attaching weld nuts to the tabs to receive the fasteners therein.

69. (previously presented) A method as set forth in claim 68, wherein:

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 24

said mounting plate forming step includes forming the mounting plate from high strength steel.

70. (previously presented) A method as set forth in claim 69, wherein:

said crush member forming step includes forming the crush member from high strength steel.

71. (previously presented) A method as set forth in claim 46, wherein:

said tab connecting step includes rigidly connecting the tab to an interior surface of an outermost one of the opposite sidewalls to absorb energy from an impact having a significant side component.

72. (previously presented) A method as set forth in claim 46, wherein:

said tab forming step includes stamping the tab from material disposed within the central opening and bending the tab forwardly along a fold edge.

73. (previously presented) A method as set forth in claim 45, wherein:

said mounting plate forming step includes forming a stiffening bead about the periphery of the central opening.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 25

74. (previously presented) A method as set forth in claim 45, wherein:

said crush member forming step includes positioning at least one of the sidewalls at a predetermined acute angle relative to the adjacent outer portion of the mounting plate to define at least a portion of the generally frustro-pyramidal shape.

75. (previously presented) A method as set forth in claim 45, wherein:

said crush member forming step includes positioning at least one of the top wall and bottom wall at a predetermined acute angle relative to the adjacent outer portion of the mounting plate to define at least a portion of the generally frustro-pyramidal shape.

76. (previously presented) A method as set forth in claim 74, wherein:

said crush member wall positioning step includes adjusting the predetermined acute angle of the opposite sidewalls to achieve the desired energy absorption for a specified impact system.

77. (previously presented) A method as set forth in claim 45, wherein:

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 26

said crush member forming step comprises selecting a predetermined wall thickness for the top wall, the bottom wall and the sidewalls to achieve the desired energy absorption for a specified impact system.

78. (previously presented) A method as set forth in claim 45, wherein:

said crush member forming step comprises forming first and second channel members, each having a substantially identical C-shaped lateral cross-sectional configuration, positioning opposed side edges of the channel members together, and rigidly interconnecting the opposed side edges along opposite seams to define the generally frustro-pyramidal shape.

79. (previously presented) A method as set forth in claim 45, wherein:

said mounting plate forming step includes forming the mounting plate with a generally flat outer portion, and with a marginal edge having a stiffening bead extending along at least a portion thereof.

80. (currently amended) A method as set forth in claim 45, wherein:

said mounting plate fastening step~~set~~ includes spot welding an outer portion of the mounting plate to an open forward end of the vehicle frame.

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 27

81. (currently amended) A method as set forth in claim 46, wherein:

said tab connecting step includes inserting a threaded fastener between the one wall and the tab to facilitate replacement of said crush member.

82. (previously presented) A method as set forth in claim 81, wherein:

said crush member forming step includes positioning the one wall at a predetermined acute angle relative to the adjacent outer portion of the mounting plate to define at least a portion of the generally frustro-pyramidal shape; and

said tab forming step includes forming from the tab at an angle relative to the outer portion of the mounting plate which is greater than the predetermined acute angle of the one wall, such that the fastener resiliently biases said tab abuttingly against the one wall to preload the fastener and securely retain the same in place.

83. (new) An energy absorption impact system for vehicle bumpers, comprising:

a mounting plate adapted to be connected with a vehicle frame, and including a central opening extending therethrough, and at least one tab extending forwardly from said central opening; and

a generally box-shaped, sheet metal energy absorbing crush member having a top wall, a bottom wall and opposite sidewalls arranged in a generally frustro-pyramidal shape, defining

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356

a larger end thereof adapted for connection with a vehicle bumper, and a smaller end thereof connected with said mounting plate about said central opening therein by rigid connection of said tab with an adjacent one of said top wall, said bottom wall and said opposite sidewalls, whereby impact on the vehicle bumper inelastically deforms said top wall, said bottom wall and said opposite sidewalls of said crush member toward said central opening in said mounting plate to absorb energy associated with the impact.

84. (new) An energy absorption impact system as set forth in claim 83, wherein:

said tab is connected with an interior surface of said one wall of said crush member, and folds inwardly with said one wall toward said central opening of said mounting plate upon impact to control energy absorption.

85. (new) An energy absorption impact system as set forth in claim 84, wherein:

said sidewalls include an innermost sidewall facing a central portion of the vehicle bumper, and an outermost sidewall facing an end portion of the vehicle bumper; and

said tab is rigidly connected with the interior surface of said outermost sidewall to absorb energy from an impact having a significant side component.

86. (new) An energy absorption impact system as set forth in claim 85, wherein:

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 29

said tab is integral with said mounting plate to define a one-piece structure.

87. (new) An energy absorption impact system for vehicle bumpers, comprising:

a mounting plate adapted to be connected with a vehicle frame, and including a central opening extending therethrough and a stiffening bead extending about the periphery of said central opening; and

a generally box-shaped, sheet metal energy absorbing crush member having a top wall, a bottom wall and opposite sidewalls arranged in a generally frustro-pyramidal shape, defining a larger end thereof adapted for connection with a vehicle bumper, and a smaller end thereof connected with said mounting plate about said central opening therein, whereby impact on the vehicle bumper inelastically deforms said top wall, said bottom wall and said opposite sidewalls of said crush member toward said central opening in said mounting plate to absorb energy associated with the impact.

88. (new) An energy absorption impact system for vehicle bumpers, comprising:

a mounting plate adapted to be connected with a vehicle frame, and including a central opening extending therethrough defined by a top edge, a bottom edge and opposite side edges;

a tab extending forwardly from each of said edges of said central opening; and

Applicants : Joseph C. Kollaritsch et al  
Serial No. : 10/779,967  
Confirmation : 9113  
Atty. Dkt. : BEN02 P-356  
Page : 30

a generally box-shaped, sheet metal energy absorbing crush member having a top wall, a bottom wall and opposite sidewalls arranged in a generally frustro-pyramidal shape, defining a larger end thereof adapted for connection with a vehicle bumper, and a smaller end thereof connected with said mounting plate about said central opening therein, whereby impact on the vehicle bumper inelastically deforms said top wall, said bottom wall and said opposite sidewalls of said crush member toward said central opening in said mounting plate to absorb energy associated with the impact.

89. (new) An energy absorption impact system for vehicle bumpers, comprising:

a mounting plate adapted to be connected with a vehicle frame, and including a central opening extending therethrough and a generally flat outer portion, with a marginal edge having a stiffening bead extending along at least a portion thereof; said outer portion of said mounting plate being spot welded to an open forward end of the vehicle frame; and

a generally box-shaped, sheet metal energy absorbing crush member having a top wall, a bottom wall and opposite sidewalls arranged in a generally frustro-pyramidal shape, defining a larger end thereof adapted for connection with a vehicle bumper, and a smaller end thereof connected with said mounting plate about said central opening therein, whereby impact on the vehicle bumper inelastically deforms said top wall, said bottom wall and said opposite
